

# Warwickshire North CCG

These Mini JSNAs have been produced at district/borough level to provide more localised data and analysis to support the future commissioning plans of Warwickshire's Clinical Commissioning Groups (CCG).

## The needs of the population

Warwickshire North CCG comprises of the Boroughs of North Warwickshire and Nuneaton & Bedworth. The combined population of the area is 187,500 (mid-2011 estimate), 34% of the total Warwickshire population. Compared with the rest of the county Warwickshire North CCG is expected to experience considerably less population growth, with North Warwickshire Borough projected to see the smallest population growth in Warwickshire. For some age groups, North Warwickshire Borough is expected to experience a negative population growth during the period 2010-2035. This could impact on the local labour market and local economy of Borough.

Health inequalities are apparent within the CCG as life expectancy in the area is lower than the Warwickshire average whilst in Nuneaton & Bedworth Borough it is significantly worse than the average for England. Data suggests an under diagnosis or under recording of Coronary Heart Disease (CHD) within Warwickshire North, yet the CHD rate is still significantly higher than that for England. Further inequalities are prominent as the CCG has high identification of people on the diabetes disease register, but there is considerable variation across GP Practices. There are significantly higher levels of patients across Warwickshire North who die in their own homes: 22.8% compared to 20.3% nationally.

In terms of healthy lifestyles, the CCG has a significantly high prevalence of obesity when compared with the national average (for both children and adults). The number of alcohol related hospital admissions has increased in the last five years in both men and women and smoking remains a high priority for the NHS within Warwickshire North.
