### Summary

This release from the Office for National Statistics includes life expectancy and healthy life expectancy estimates for local areas across the UK, in addition to constituent countries and English regions, from 2001-03 to 2014-16.

Period life expectancy at a given age for an area is the average number of years a person would live, if he or she experienced the particular area's age-specific mortality rates for that time period throughout his or her life.

### Key Findings - national

- Life expectancy, in England, at birth for males was 79.5 years and for females 83.1 years in 2014-16.
- Healthy life expectancy (HLE) at birth for males was 63.1 years and for females was 63.7 years in 2014-16.
- HLE at birth across local areas of the UK varies by 18 years, while disability-free life expectancy (DFLE) at birth varies by 20 years.
- Females continue to live more years in good health than males, despite their HLE decreasing by 1.7 months since 2009 to 2011 and that of males increasing by 4.3 months over the same period.
- It is estimated that half of newborns in the UK could expect to still be alive at the age of 82.3 years if male and 85.8 years if female; the largest number of deaths for males are expected to occur at age 86.4 years and at age 88.9 for females, if they experience the same mortality rates as were observed in the period 2014 to 2016.
- The rate of improvement in life expectancy at birth in the UK during the first half of the second decade of the 21st century was 75.3% lower for males and 82.7% lower for females when compared with the first half of the first decade; therefore, improvements in life expectancy have slowed during the second decade.
- Females live three years longer in "not good" health than males in the UK.
